We have a graph  $G = (V, A)$  with  $|V| = n$ ,  $|A| = m$ . We'll use the following fact: If there exists no directed cycle in  $G$ , then there exists a vertex with ingoing degree 0.

Proof: Suppose there is no vertex with ingoing degree 0. Then, we can go through each vertex and keep going, but as the number of vertices is finite, there has to be a point at which we go through a vertex already visited previously, thus we went through a directed cycle.

We calculate the ingoing degree of each element ( $\deg(v) = |\{(u, v) \in A, v \in V\}|$ ), which takes  $O(m)$  arithmetic operations. If there exists no directed cycle, we can find a vertex with ingoing degree 0. We look for all such elements and add them to the queue. This takes  $O(n)$  arithmetic operations the first time we do it, but we'll be able to do it for  $O(1)$  every other time. If we cannot find a vertex with ingoing degree 0, we assert that there exists a directed cycle. We remove the said vertex and every edge that touches it from the graph, and put it as the right element in our topological sort. We can update the degree of each element in our table, which will take  $O(m)$  operations in total (every edge will be removed once during the entire algorithm). During the update of the ingoing degrees, for each vertex we update, we check if its ingoing degree is 0, and if yes we add it to the queue of elements to be removed, which takes  $O(1)$  arithmetic operations. We then repeat this process at most  $n$  times and get either a topological sort or assert that there exist a directed cycle.

## 1 The Algorithm

Input: A graph  $G = (V, A)$  with  $|V| = n$ ,  $|A| = m$ .

Output:  $T$ , a topological sort.

Initialization:

$D = [|\{(u_1, v) \in A, v \in V\}|, \dots, |\{(u_n, v) \in A, v \in V\}|]$ ,  $Q = \emptyset$ ,  $T = []$

For $i = 1 \rightarrow n$ :
If $D[i] = 0$ , add $v_i$ to $Q$ .

While $Q \neq \emptyset$ :
Choose $q \in Q$ . Remove $q$ from $G$ : $V := V \setminus \{q\}$ $T := [T \ q]$ Update D:
$\forall e = (q, s) \in \{(q, v) \in A, v \in V\}$ :
$D[s] := D[s] - 1$ $A := A \setminus \{e\}$ If $D[s] = 0$ , $Q := Q \cup \{s\}$ .

If  $Q = \emptyset$  and  $V \neq \emptyset$ , assert there exists a directed cycle in  $G$ , otherwise return  $T$  the topological sort.

Don't forget that  $Q$  is just an unsorted set while  $T$  has a set order, if  $i < j$ , then  $T[i] < T[j]$ .

Total Running Time :

We showed that our algorithm needs  $O(m)$  arithmetic operations for the calculation of the degrees,  $O(n)$  for the zero-degree vertices search and  $O(m)$  for the update of the degrees. Thus, the total running time is in  $O(m + n)$ .
